AR-Mini · Two desks, two consultants, one human

Every extra AI is one more context to carry by hand. Claude thinks and keeps the files, Cursor writes the code, Gemini and ChatGPT are called with a question. · v3 · 09.10.2026

TEDDY · human in the loop

Measures, prints, wires, tests in water, films with the iPhone, decides. Closes every loop in the tracker. Merges dev → main only after a physical test.

decides · builds · measures · films · merges main

iPhone

numbers, photos, decisions ↓ ↑ *plan, files, hypotheses*

tasks, review, merge ↓ ↑ *code, tests, PRs*

DESK 1 · Claude

architect · coordinator · logistics · portfolio drafts

Sees everything

- the loop tracker (reads it directly)
- the repo folder on the Mac (writes files into it)
- scripts: CAD, BOM with photos, posters, 3D
- the whole history since 28.09

Does

- morning: “plan for today” → 3 priorities from the tracker
- decisions → docs/decisions, CAD versions, STATE.md
- parts search → straight into the BOM
- FAILS_AND_FIXES, LOG, portfolio texts (only proven loops)
- night-task specs for Cursor

→ files in the repo · commits docs + cad to dev (with delete permission)

DESK 2 · Cursor

software engineer · the only one that acts on files

Sees

- the repo and .cursor/rules/ar-mini.mdc
- tasks/night/*.md with a definition of done
- tasks/inbox from Desk 1

Does

- firmware (ESP32-S3, PlatformIO), bench sketches, scripts
- runs the tests, runs scripts/check.sh before every commit
- night tasks in parallel: branch night/* → PR to dev
- never touches main, never invents pins or sizes
- stops after 3 failed attempts and writes why

→ commits to dev · PRs from the night · CI green or red

On call

3 lines of context + one question. They keep no context; STATE.md is what you paste.

Gemini

video · datasheets · images

- “at which second does the hull tilt?”
- long PDFs: ESP32-S3, BTS7960, MLX
- illustrations for the portfolio

ChatGPT

second opinion before risk

- first 12 V on anything
- a print longer than 4 h
- an order over 50 €

Dropped: Grok, one Project per role.

Where things live

- **Projects/ARmini** the local folder = the working copy of the repo; Desk 1 and Desk 2 both write here
- **GitHub** history, CI checks, proof of dates; dev = AI, main = Teddy
- **iCloud** photos and video: AR-Mini-Media/01_Loops/L###
- **Tracker** AR-Mini Loop: every cycle, every task, the numbers
- **STATE.md** one page, updated after every decision; the only file that travels

The day

- **07:00** plan: Claude reads the tracker, 3 priorities
- **day** loops: measure, film, close in the tracker
- **→** decision → file → commit (Claude) · code → PR (Cursor)
- **→** test video → Gemini · risky step → ChatGPT
- **evening** STATE.md updated · night tasks to Cursor
- **night** Cursor works, printer prints, Teddy sleeps

Runs without Teddy

- Claude commits docs and CAD to dev (after delete permission in the folder)
- scheduled task 07:00: tracker → 3 priorities → Tasks tab
- Cursor night tasks → PRs by morning
- GitHub Actions: OpenSCAD, ERC/DRC, firmware build, Gerber export
- the printer, overnight

Never without Teddy: a merge to main, a test, a number.
