AR-Mini · GitHub: states and what I do when

Agents and Cursor write code on branches · CI checks every push · only Teddy merges, and only Teddy touches main · v1 · 10.10.2026

1 The branches

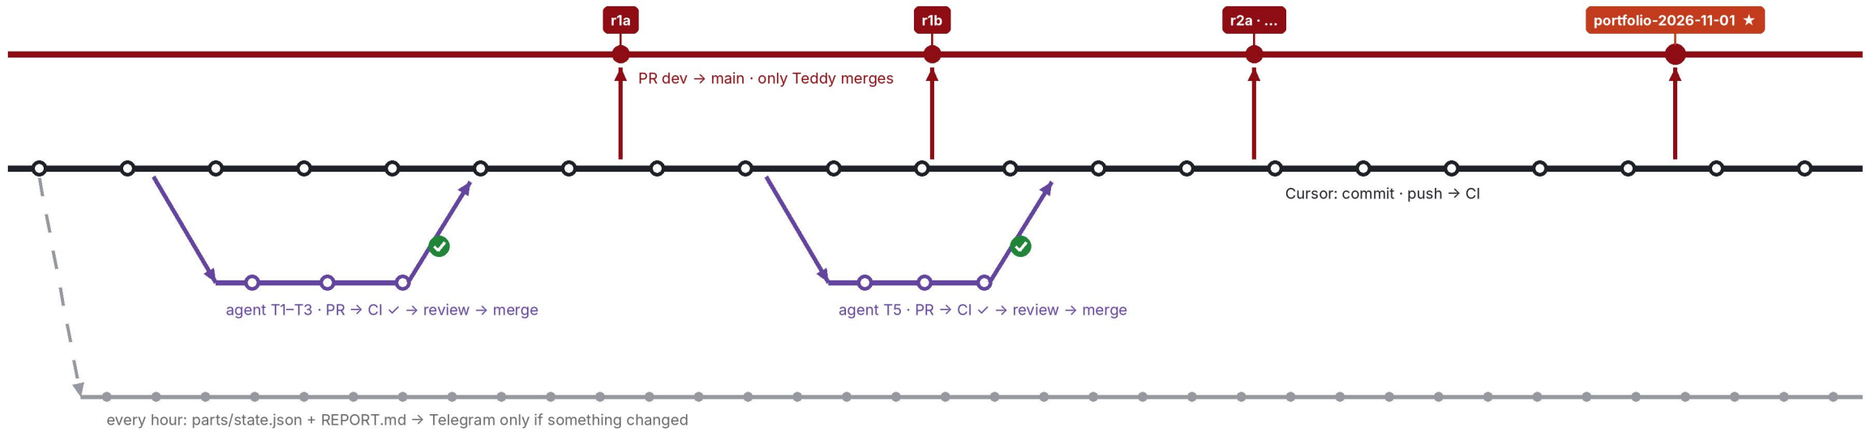

one line per branch · a dot is a commit · time runs to the right

`main`
Only Teddy merges into it (PR from dev). Release tags live here. Public from 30.10.

dev
Daily work. Cursor commits here ("commit: ..."). CI on every push.

`night/<task>`
One agent = one branch. Ends with a PR into dev.

`parts-bot`
Parts agent writes here every hour. Never merged.

2 A night task, state by state

top line = what GitHub shows · orange text = what I do

1 Task written
`tasks/night/T#.md is on dev`
Claude writes the task file with me; Cursor commits it.

2 Agent working
`branch night/<task> gets commits`
Evening: start a Cloud agent with the task prompt. Then sleep.

3 PR open · CI running
`PR #N into dev, check ● yellow`
Wait ~8 min. Nothing to do.

4 CI green
`"1 check passed"`
Read the PR description. Ask Claude to review it file by file.

5 Reviewed
`green "Merge pull request" button`
Merge only what I understand → Confirm → Delete branch.

6 Merged into dev
`purple "Merged"`
Card done on the board. Cursor: git switch dev && git pull.

fails

push → CI again

push → back to 3

review finds something

CI red
`"1 check failed"`
Checks → the red step → the error (or Claude opens the log). One fix prompt to Cursor on the SAME branch → push → CI runs again.

Changes needed
unclear, wrong or unsafe in the review
Fix prompt to Cursor on the same branch → push → back to step 3. A wrong idea: close the PR without merging and rewrite the task.

Never
- merge with CI red
- merge what I do not understand
- AI pushes to main
- photos or keys in git

3 When I do what

Evening
- Agree the night tasks with Claude.
- Start one Cloud agent per task (night/<task>).
- Start the long print.

Morning · 20 min
- GitHub → Pull requests: green or red?
- Red → Claude reads the log → fix prompt.
- Green → review with Claude → merge what I understand.
- Cursor: switch to dev, pull.

Daytime
- Cards on the board; photos → "C### inbox".
- Cursor commits on dev: "commit: ...".
- Every push runs CI. Red first, then anything else.

Release day
- Board: cut R1a → Export JSON → commit.
- PR dev → main → green → I merge.
- make.py r1a → read the shot list → Publish the draft Release.
- 30.10: C013 → tag portfolio-2026-11-01 → Public.

Automatic
- Every push / PR: CI (CAD, PCB DRC, firmware build + tests).
- Every hour: parts agent → parts-bot → Telegram if something changed.

Colours: red-brown = main · black = dev · purple = agents / night/ · yellow = CI running · green = CI passed · red = CI failed · orange text = my action.*
