AR-Mini · How information flows

One ID everywhere: C006 is the card, the iCloud folder, the file names, the video caption and the commit. · v1 · 09.10.2026

iPhone

take photos · check the board · read Telegram

- Photos and video: the instrument in frame with every number; video 4K landscape.
- Files → iCloud Drive / AR-Mini-Media / 00_Inbox (or AirDrop to the Mac).
- AR-Mini Board in the Claude app: the card from Today → Done, result, Pass / Fail.
- Telegram: the parts agent writes "order by ...", GitHub "PR green".

1 photos, video → 00_Inbox

2 the card: result, Pass / Fail

Claude — Desk 1

workshop chat + AR-Mini Board · decisions and files

Workshop chat

- Architecture, CAD / EDA files, decisions (docs/decisions)
- Logistics: specs for the agents, BOM
- Writes straight into the folders on the Mac; sorts iCloud
- Portfolio: texts, posters, STATE.md

AR-Mini Board (artifact)

- Cards C### · Backlog → Today (max 3) → Done → Release
- Hypothesis with a number, result, Pass / Partial / Fail, link
- Releases r2a... with a goal and a date
- Export JSON → backup in the repo

Consultants: Gemini video, datasheets · ChatGPT second opinion before risk

9 Telegram: "order N003 by 14.10", "PR green"

iCloud

AR-Mini-Media · photos and video, never in git

```
00_Inbox/                                  raw from the phone
01_Loops/C006_2026-10-09_esc-9v/           one folder per card
   C006_01.HEIC … C006_07.MOV              ID + number
   captions.md                             what each photo shows
02_Parts/  03_Prints/  04_Releases/
05_Fails/  06_Edit/  07_Portfolio/         the end: the MIT video
```

Claude files them for you: say "C006 inbox: ESC arms at 9 V" → the files go into the card folder with the right names and captions. iCloud is mounted on the Mac, so Claude reaches it there.

3 iCloud Drive syncs

4 reads and writes files: CAD, docs, tasks; sorts 00_Inbox → C###

5 Export JSON → data/board

Mac · the local folders

Claude, Cursor, iCloud and git meet here · the only place where a file is "real"

~/Projects/ARmini

git · branch dev · linked to Claude and Cursor

```
cad/openscad/        AR-Mini_v1.scad (CAD)
pcb/  firmware/      KiCad, PlatformIO
docs/                STATE.md, decisions, fails
tasks/night/         T1...T5 for Cursor
parts/needs.yaml     what is missing, by release
data/board/          board.json (board backup)
tools/{parts,video}  the agents (code)
scripts/check.sh     check before every commit
```

iCloud Drive / AR-Mini-Media

the same folder as on the phone, synced

- Claude reads 00_Inbox and writes into 01_Loops/C###
- tools/video reads from here when it cuts a release video
- Photos must be downloaded on the Mac ("Download now"); otherwise they are only in the cloud and nothing can read them

Teddy

8 gh release: video r2a

GitHub

TKyoseva/ARmini · the truth for code and documents

Branches

dev — everything from Cursor and Claude · main — only after a physical test, only Teddy merges · night/* — night tasks → PR to dev

Actions

check.yml on every push: OpenSCAD, KiCad ERC/DRC, PlatformIO, tests · parts.yml every hour: prices, stock, "order by" → Telegram

Branch parts-bot

parts/REPORT.md and state.json — the agent writes only here, dev stays clean

Releases

tags r2a, r2b... with the video attached (from tools/video on the Mac); the video never enters git history

Secrets

TELEGRAM_BOT_TOKEN, TME_TOKEN, MOUSER_API_KEY ... never in the code

6 edits code, check.sh, commit to dev

CURSOR — Desk 2

all the code · every commit · the pull requests

Chat in the repo (dev)

```
commit: <what>   ·   inbox
add need: … for r2c
ordered N003, eta 14.10 · received N003
parts report   ·   fix: <error from CI>
```

Background Agent (night/*)

- One line: "Read the rules, then tasks/night/...T4...md, and do it."
- Works while you sleep; ends with a PR to dev; never merges
- You read the PR description in the morning and decide

7 push dev · PR night/* · CI result back

What flows along the arrows: Teddy and Claude (decisions, cards, files) · phone and Cursor (photos, code) · iCloud sync · git: push, PR, CI · release · alerts

Claude does not push to GitHub: every commit goes through Cursor and check.sh. Only Teddy touches main. Photos and video never enter git.
